FARR Grooves in Corrugated Box Job

Product: Gold Series
Size: GS108 Designed for 75,000 CFM
Application: Corrugated Box Dust
Customer: Packaging Corporation of America - Phoenix, AZ
Salesman: Airsystem Sales, Inc.

Challenge

Packaging Corporation of America had been using competitive baghouses to collect paper dust off the back end of a scrap handling system in their corrugated box facility. The plant was putting in whole new scrap systems and quickly outgrew the old collectors, which were already performing well below their satisfaction. Saws, cutters and bailers are part of this big operation and a collection system to handle 75,000 CFM was needed.

Solution

Proudly, Farr was requested by name based on our reputation and the contractor's experience with Farr collectors at other facilities. Our sales rep, Scott Williams of Airsystem Sales, worked with the contractor and

sized up a 108 cartridge Gold Series unit with PWS wide pleat cartridges and overbags. The dust is gathered by hoods, then goes through an air stripper before entering the GS108.

The system has been running successfully since November 2003 and the customer is happy with its performance.
